Information on our product range

For many years, myonic has been supplying **AXZN** and **AXZF series needle roller/axial cylindrical roller bearings** to the global machine tool market. These bearings are mainly used in screw drives.

As part of the realignment and focusing of our product portfolio, we intend to discontinue the AXZN, AXZF and DRS standard series.

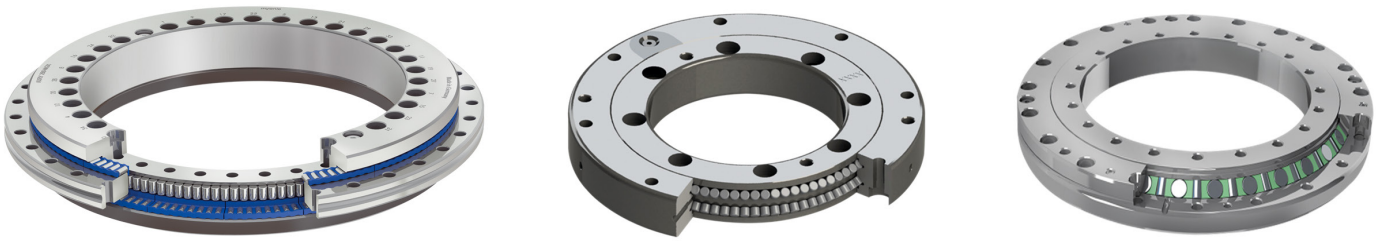
We will of course fulfil existing supply contracts.
In order to avoid delivery shortages in your company, we will be pleased to arrange further deliveries taking into account the availability of parts.

Since the technology is still available in our company, we can continue to offer selected sizes and special project-related designs.

Our sales team looks forward to discussing the next steps with you.

Next Generation of Machine Tool Bearings

As part of our strategic orientation, we will focus on the development and production of our high-quality machine tool bearings: axial/radial bearing (AXRY), crossed roller bearing (AXCR) and double-row angular contact roller bearings (AXDR).



The Next Generation of our AXRY series (NGX/NGS) sets a benchmark in rigidity and permissible speeds, opening up completely new application possibilities.
